

FileJet

Send any file, any size, straight into the right folder

Secure folder sharing and large-file delivery directly between computers - no cloud storage, no size cap, full control over who does what.

Direct P2P · Metadata-only cloud · Per-person permissions

What FileJet is for

One desktop app to share folders and deliver big files - the data never touches a cloud server

Direct delivery

Files go straight from the sender's PC into the owner's folder on their own disk or NAS, over TLS 1.3 with parallel streams.

Shared folders

Share a folder with people by their 9-digit ID. Each person gets exactly the rights you choose - upload, view, edit, delete.

Metadata-only cloud

The cloud keeps who sent what, when, the size and status. Never file contents, local paths or form values.

Example: a studio shares "Movie Project" with three editors. Two may upload, one may also download, rename and delete. Footage lands on the studio's own storage at full line speed, and the web dashboard shows only names, sizes, times and status.

The problem with today's tools

Teams that move large or sensitive files keep hitting the same walls

2×

Double wait

Cloud tools upload everything first, then the receiver downloads it again.

\$

Storage bills

Paying per TB to park files that only need to travel from A to B.

+1

Extra copy

Sensitive files sit on someone else's servers, often longer than needed.

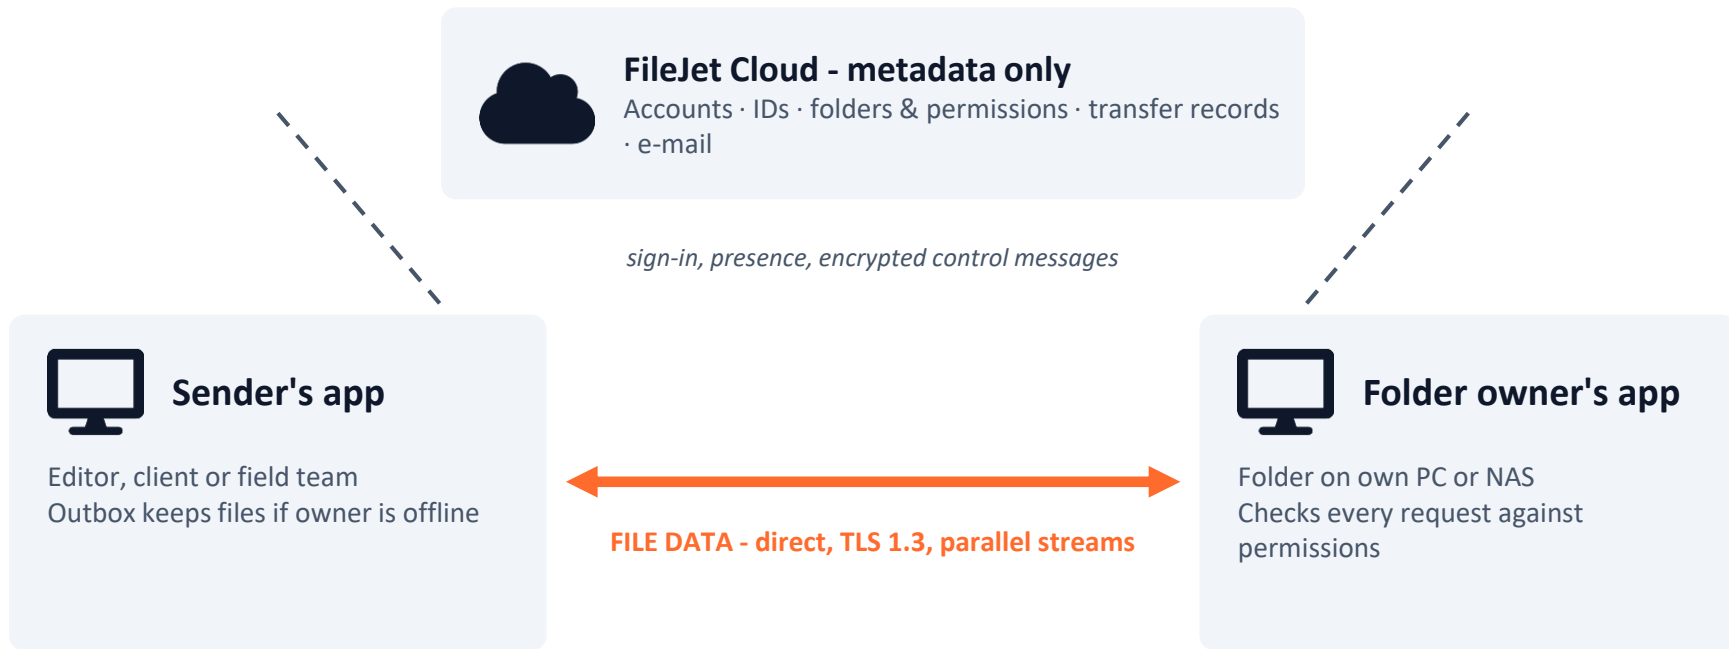

0%

Restart from zero

A dropped link or power cut can mean re-sending a 50 GB file from the start.

How FileJet works

The cloud coordinates; the file data travels one hop, computer to computer

Everything in one app

Sharing · permissions · security · big-file engine · collaboration · administration

Folder sharing, Media Shuttle style

Share existing folders on your PC or NAS - every user can both share and receive

Share folder

People browse, upload and download as permitted. Each folder gets an ID like FD-7K3M-9QX2.

Submit folder

A drop box: senders deliver files in but cannot see what's already there.

File rules

Optional allowed types and max size, checked before sending and again by the owner's app.

Upload forms

Fields like Project* or Notes. Values stay on the owner's PC only.

Users & groups

Add people by 9-digit ID, username or e-mail. Share with whole groups at once.

Your own storage

Free space is shown; uploads that won't fit are refused before they start.

Precise permissions per person

Changes apply immediately - even to transfers already running

Role	View & download	Upload	Edit	Delete
Uploader	—	✓	—	—
Viewer	✓	—	—	—
Editor	✓	✓	✓	—
Manager	✓	✓	✓	✓
Custom	Any combination of the four rights			

Expiry dates

Access ends automatically on the chosen day.

Delete scope

Allow deleting only their own files, or any file.

Owner-enforced

The owner's app checks every request; paths stay inside the folder.

Security built into every step

Verify people, approve uploads, encrypt everything - per member, per folder

One-time code (OTP)

Before the first transfer a member confirms a 6-digit code - valid 10 min, 5 tries.

Upload approval

None, first upload only, or every upload. Nothing lands until the owner accepts.

Encryption

TLS 1.3 with pinned device certificates; chat and control messages E2E (AES-256-GCM).

Devices & accounts

Per-install ECDSA keys, revocable on the web. JWT sessions with rotating refresh.

OTP delivered by

E-mail

SMS

WhatsApp

Full activity log: uploads, downloads, renames, deletes, joins

A transfer engine built for huge files

10 GB, 100 GB and beyond - chunked, verified and resumable

355 MB/s

measured on a 3 GB file (~2.8 Gbit/s)

8 MiB

chunks, each SHA-256 verified

< 512 MB

RAM for any file size

Resume anywhere

Network drop or power cut?
Continue from the last verified chunk.

Offline outbox

Owner offline? Files wait on the sender's PC and deliver automatically later.

Smart connection

LAN, IPv6, UPnP, STUN and TCP hole punching. Never a file relay.

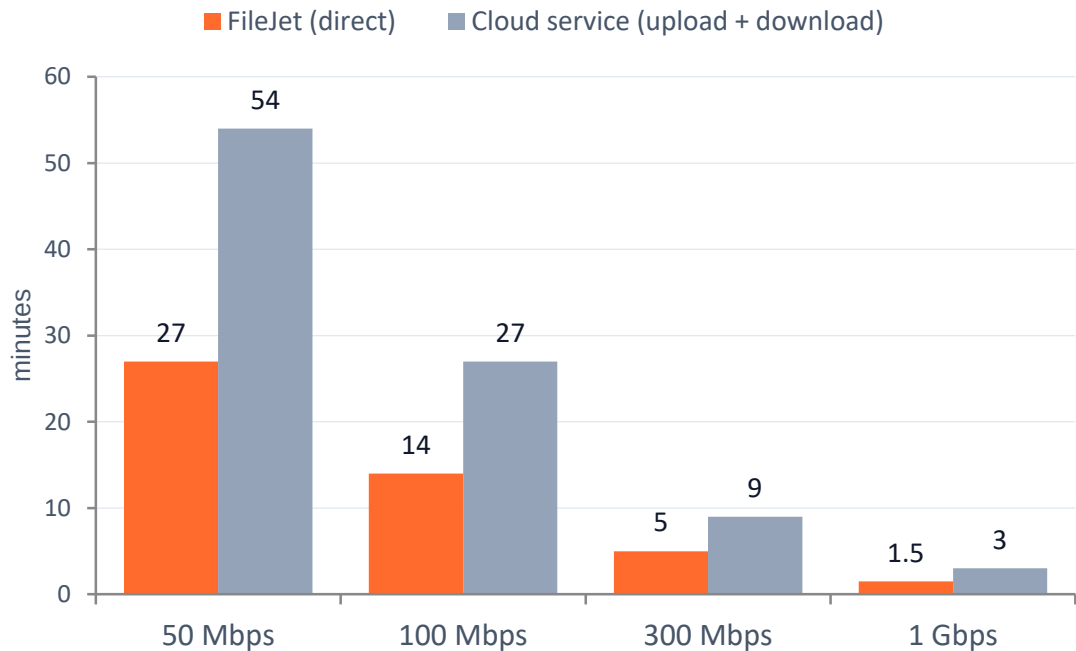

Thumbnails

Image and video previews, sent end-to-end encrypted to the owner.

One hop instead of two: half the wait

Minutes until the receiver has a 10 GB file (same internet speed on both sides)

2×

faster to the receiver

Cloud tools must finish the upload before the download can finish. FileJet writes straight into the destination folder.

Collaboration and full visibility

Everyone sees what is happening - without the cloud seeing the files

Built-in chat

Chat with linked users, online status, delivered and read ticks, offline messages.

Live progress

Sizes, speed and time left on both sides while a transfer runs.

Received files

Owner's list of who sent what and when, with form values. Open or show in folder.

Notifications

Invitation e-mails with the folder ID; one e-mail per completed batch.

Web dashboard

Live transfers, full history, per-folder size and share count, users, devices.

Modern desktop UI

Dark design, resizable VS Code-style panels, keyboard shortcuts, saved layout.

Run it your way

Self-hosted cloud, simple installers and built-in administration

Self-hosted cloud

One installer for Windows or Linux servers, starts at boot. Docker optional.

Desktop app

Installable app for every user - share and receive in the same window.

Super admin

Oversee all users, folders and activity from one place.

Support desk

Tickets with chat-style replies, categories, priorities and assignment.

Device control

See every registered device and revoke one instantly from the web.

Your organization

Organization name, groups and per-folder statistics for every team.

Who uses FileJet

Any team that moves large or sensitive files every day

Video & film studios

Crews send 50-200 GB of footage after every shoot into an Upload-only folder.

Creative agencies

Same-day 4K deliverables to clients via a View & download folder.

Architecture & engineering

CAD, BIM and point clouds between offices and sites, with Edit only for leads.

Legal, finance, health

Contracts, IDs and scans via a Submit folder with OTP and approval of every upload.

Field & remote teams

Unreliable links and power cuts - transfers resume, never restart.

Software & game studios

Daily multi-GB builds and assets shared with testers.

How FileJet compares

General characteristics from public information, October 2026 - check vendors for current plans

	FileJet	Dropbox	Google Drive	WeTransfer	Media Shuttle	FTP / SFTP
Files stored on a 3rd-party server	No - direct	Yes	Yes	Yes, temporary	Your storage	Your server
Storage cost	None	Per plan	Per plan	Plan-limited	Enterprise	Server + disk
Per-person folder permissions	4 rights + expiry	View / edit	Viewer / editor	Link only	Portals	Server accounts
OTP + upload approval	Yes - 3 OTP channels	No	No	Sender e-mail	Portal settings	No
Deliver while receiver offline	Yes - outbox	Yes - cloud	Yes - cloud	Yes - cloud	Yes	Yes
Built-in chat & presence	Yes	No	No	No	No	No
History with every retry	Yes	Partly	Partly	Partly	Yes	Logs only
Recipient needs	App + account	Account / link	Account / link	Browser only	Browser / app	FTP client

Where FileJet wins - and where others fit

An honest positioning that builds trust with buyers

Choose FileJet when you need

- Large files fast, with no cloud copy and no storage bill
- Strict control over who sends what: roles, OTP, upload approval
- Delivery that survives outages and offline receivers
- Files kept on your own disks or NAS for compliance

Dropbox / Google Drive

Online backup, versions and browser editing

WeTransfer

Quick one-off send to someone with no app

Signiant Media Shuttle

Enterprise media pipelines into managed storage

FTP / SFTP

Automated server-to-server scripts

Get started in three steps

From install to first delivery in minutes

1

Install & sign up

Install the FileJet app and create an account. You get a 9-digit ID.

2

Share a folder

Pick a folder on your PC or NAS, add people by ID and choose their rights.

3

Send & receive

Drag in files of any size. FileJet delivers, verifies and keeps the record.

FileJet - move big files securely, keep control, and skip the cloud storage bill.
