

FileJet

User use cases and comparison with Dropbox and other file transfer tools

FileJet moves large files and folders **directly from one computer to another**. Files never pass through or sit on a cloud server - the cloud only keeps details such as names, sizes, times and status. That is why there are no storage fees, no upload-then-download wait, and no copy of your files on someone else's servers.

How it works in three steps

Step	What you do	What FileJet does
1. Share a folder	Pick a folder on your computer, choose people by their user ID and set what each person may do: View & download, Upload, Edit, Delete.	Sends each person an invitation by e-mail and shows the folder under <i>Shared with me</i> in their app. They accept or decline.
2. Send or receive	Drag files or whole folders into the shared folder - even 10 GB and more.	Splits files into 8 MB chunks, sends them over several encrypted connections at once and checks every chunk (SHA-256).
3. Done - even after interruptions	Nothing. If the network or power drops, or the other person is offline, just carry on later.	Waits in the sender's outbox and resumes from the last verified chunk. Shows size, speed, time left and a full history with every try.

Built-in security choices per person

Option	What it means
Permissions	View & download, Upload, Edit, Delete - set separately for each person, with an optional end date.
E-mail code (OTP)	Before the first transfer the person confirms a 6-digit code sent to their e-mail. Valid 10 minutes, 5 tries.
Upload approval	No approval, first upload only, or every upload. Uploads wait until the folder owner presses Accept; Reject stops them.
Encryption	TLS 1.3 on every connection; chat and control messages are end-to-end encrypted between the two apps.

User use cases

Typical situations and how FileJet handles them.

#	Who	Situation	How they use FileJet	Result
1	Video production studio	Freelance camera crews send 50-200 GB of footage after every shoot.	The studio shares an <i>Uploads</i> folder (Upload only) with each crew member.	Footage lands directly on the studio's storage at full line speed - no cloud storage bill.
2	Creative / ad agency	Final 4K deliverables of 20-80 GB must reach the client the same day.	The agency shares a <i>Deliveries</i> folder with the client (View & download).	The client downloads straight from the agency; progress, speed and time left are visible to both.
3	Architecture / engineering firm	Large CAD, BIM and point-cloud files move between offices and site teams.	Each project folder is shared with the right people; Edit only for leads.	Per-person permissions, a full activity log and no copies on third-party servers.
4	Company receiving sensitive documents	Contracts, IDs or medical scans from outside people.	Shared as a <i>Submit</i> folder with e-mail code (OTP) and <i>approve every upload</i> .	Only verified people can send, and nothing arrives before the owner accepts it.
5	Team on unreliable internet	Field offices with frequent network or power cuts.	Send as usual; FileJet keeps the file in the outbox.	Transfers resume from the last verified chunk - no restarting a 10 GB file from zero.
6	Sender while the receiver is offline	The receiver's PC is off at night or over a weekend.	The sender drops files into the shared folder anyway.	Delivered automatically as soon as both computers are online.
7	Software / game developers	Daily builds and assets of many GB for testers.	A <i>Builds</i> folder shared with testers (View & download).	Fast parallel transfers; testers see the folder size grow as new builds arrive.
8	Schools and training centres	Students hand in large project files.	A Submit folder per class with Upload only and an end date.	Teachers see who sent what and when; access ends automatically.
9	Platform owner / support team	Customers report problems and need help.	Users open a request in the app; employees answer in the staff console.	Support chat, user list, plans and expiry dates in one place.

Comparison with other file transfer tools

General product characteristics based on public information as of October 2026. Plans and limits of other products change - check each vendor for current details.

	FileJet	Dropbox	Google Drive	WeTransfer	Signiant Media Shuttle	FTP / SFTP server
Where your files go	Directly to the other person's computer	Stored on Dropbox's cloud servers	Stored on Google's cloud servers	Uploaded to WeTransfer's servers, kept for a limited time	Into the company's own storage (cloud or on-premises) via Signiant	Stored on a server you run or rent
File passes through a third-party server	No - only metadata goes to the cloud	Yes	Yes	Yes	Partly - transfer service is Signiant's, storage is yours	Yes - your own server
Storage cost	None - uses your own disks	Paid per storage plan	Paid per storage plan	Not storage-based; transfer size limited by plan	Enterprise pricing	Server and disk costs
Large files (10 GB+)	Yes - limited by plan (Free 20 GB per file, Pro/Business unlimited)	Yes - large files via the desktop app	Yes - single files up to 5 TB, daily upload limit	Limited - small on the free plan, larger on paid plans	Yes - built for very large media	Yes
Speed approach	Parallel encrypted streams, one hop sender to receiver	Upload to cloud, then download (two hops)	Upload to cloud, then download (two hops)	Upload to cloud, then download (two hops)	Accelerated transport (UDP-based)	Usually one stream; slow over long distances
Resume after network / power loss	Yes - from the last verified chunk	Yes - desktop sync	Partly - depends on client	Limited - browser upload	Yes	Partly - depends on client
Send while the receiver is offline	Yes - outbox, delivered when both are online	Yes - via the cloud copy	Yes - via the cloud copy	Yes - via the cloud copy	Yes - via storage	Yes - via the server
Per-person folder permissions	Yes - View, Upload, Edit, Delete + end date	Yes - view / edit	Yes - viewer / commenter / editor	No - link based	Yes - portals and members	Partly - server accounts
Upload approval / e-mail code	Yes - OTP and accept-each-upload per person	No - not per upload	No - not per upload	Partly - e-mail verification of the sender	Partly - portal settings	No
End-to-end privacy	Yes - no file copy outside the two computers; TLS 1.3	Partly - encrypted in transit and at rest; E2E only on some team plans	Partly - encrypted in transit and at rest; client-side encryption on some plans	Partly - encrypted in transit and at rest	Partly - encrypted transfers into your storage	Partly - SFTP encrypted, plain FTP is not
Chat and who is online	Yes - built in	No	No - separate tools	No	No	No
Full history with every retry	Yes - one row per file, failed tries and reasons	Partly - activity and versions	Partly - activity	Partly - transfer list	Yes - reporting	No - server logs only
Recipient needs	FileJet app and account	Account (or shared link)	Account (or link)	Only a browser	Browser or app	FTP client and login
Works when both sides are on very strict networks	No - needs one reachable side (UPnP, port forward or IPv6)	Yes	Yes	Yes	Yes	Yes - if the server is reachable

Time until the receiver has a 10 GB file

Example only: both sides have the same internet speed and the network is not the bottleneck elsewhere. Cloud tools must finish the upload before the download can finish, so the receiver waits for two hops; FileJet needs one. Real results depend on the slower of the two connections, distance and disks.

Internet speed (both sides)	FileJet (direct, one hop)	Cloud service (upload + download)	Single-stream FTP over a long distance
50 Mbps	about 27 min	about 54 min	about 27 min or more
100 Mbps	about 14 min	about 27 min	about 14 min - often slower
300 Mbps	about 5 min	about 9 min	often limited to 50-100 Mbps by distance
1 Gbps	about 1.5 min	about 3 min	often limited to 50-200 Mbps by distance

Which tool fits which need

You need ...	Best fit	Why
Large files fast, no cloud copy, no storage bill	FileJet	Direct transfer, parallel streams, files stay on your computers.
Strict control over who sends what	FileJet	Per-person permissions, e-mail code and upload approval.
Online backup, file versions, editing documents in the browser	Dropbox / Google Drive	Cloud storage keeps copies and versions and works from any device.
Quick one-off send to someone with no app or account	WeTransfer	Only a browser and an e-mail address are needed.
Enterprise media pipelines with accelerated transport into managed storage	Signiant Media Shuttle	Built for broadcast and studio workflows at enterprise scale.
Automated server-to-server jobs and scripts	FTP / SFTP	Simple, widely supported, easy to script.

Good to know about FileJet

Point	Detail
Both computers must meet online	There is no cloud copy, so sender and receiver must be online at the same time at some point. The outbox delivers automatically when they are.
Strict networks	If both sides are behind very strict networks (some mobile data, hotspots), a direct path may not open. Fix: UPnP or a port forward on one side, or IPv6.
Keep the original until done	The sender keeps the file in place until it shows completed; a changed file restarts from 0 %, a deleted one cannot be sent.
Plans	Free: 20 GB per file, 200 GB per month, 5 users, 3 folders. Pro (\$19/month): unlimited file size, 5 TB per month, 100 users, 50 folders. Business (\$49/month): unlimited.
